August 29, 1996

Gentlemen:

Please this to confirm that "Temp-Coat Environmental Liquid Insulation" has passed and exceeded, Salt Fog Testing conducted under laboratory conditions at McDonnell Douglas Aircraft Co.

Salt Fog Testing was conducted in strict accordance with ASTM B117. Temp-Coat was exposed under the proscribed test parameters for a period in excess of three (3) months, more than 2, 100 hours continuous. (Note that the industrial norm is generally accepted as successful at 200 hours).

At the conclusion of this testing Temp-Coat exhibited no visual material degradation. Additionally, it was noted that no denigration of bonding / adhesion of Temp-Coat to the metal substrate had occurred nor was any corrosion noted to the Temp-Coat surface.
